## RATIONALE of the MEETING

Interventional pulmonology is by now an integral part of pulmonary medicine, offering advanced consultative and procedural services to patients with acute and/or chronic airway/pulmonary diseases, as well as in the diagnosis and management of patients with thoracic malignancy.

Aim of the meeting is to focus with several experts the rapid advancements in these fields over the last years, which have led to development of various new minimally invasive bronchoscopic diagnostic and therapeutic approaches and techniques for patients with lung cancer, and alongside new pharmacologic therapies also in patients with chronic lung diseases such as asthma, chronic bronchitis, chronic obstructive pulmonary disease and emphysema.

Newer technologies are now available, navigation platforms and robotic endoscopy are now a reality to diagnose and to possibly treat peripheral pulmonary nodules, endobronchial ultrasound to diagnose mediastinal and hilar adenopathy and to stage lung cancer, as well as cryobiopsy for the diagnosis of lung cancer and diffuse parenchymal lung diseases.
